

What Are We Learning about Learning from Experiments? (It Depends.)

Justin Sandefur

Center for Global Development

July 17, 2013

Outline

Cataloging what works

- Lexicographic evidence rankings
- Highly clustered evaluations
- Meta-analysis
- Global policy prescriptions

What have we learned?

- Contract teachers
- Class size
- Private schools

Where are we going?

- Rigor versus relevance
- Evaluation & scale-up
- Conclusions

2 of 4: Highly clustered evaluations

Caroline Fiennes, *SSIR* 2013, “Most Charities Shouldn’t Evaluate Their Work”

$$\textit{impact} = \textit{idea} \times \textit{implementation}$$

“the ideas used by charities don’t need to be evaluated again, because they’ve been amply evaluated already. . . . All the charity then needs to do is run the programs well.”

Table 2.4
Program costs

Program (recurring annual expenditure)	Source and method of calculation	Randomized?	Cost (US\$2000 millions)
Education			
Remedial teaching based on the Balsakhi model developed by Pratham	Source: Banerjee et al. 2003. Calculation: Unit (cost per child-year), $BalkhashiCost$, from the Pratham 2001–2002 Reports (cited on June 28, 2003). Available at www.pratham.org/reports . We use the mean of costs reported for the Delhi, Mumbai, and Pune regions. Country cost = $BalkhashiPop * BalkhashiCost * GDPCorrection$	Yes	644
Universal education based on a 40:1 pupil-teacher ratio	Source: Angrist and Lavy 1999 ¹ Calculation: Country cost = $NotInSchool * SchoolCost$	No	1,544
School inputs (uniforms and textbooks)	Source: Kremer, Moulin, and Namunyu 2003. Calculation: Unit $InputsCost$ from Kremer et al. (p. 44). Transportation costs ignored. Country cost = $InputsCost * SchoolAge * PPPCorrection$	Yes	2,268
Schooling vouchers	Source: Angrist et al. 2002. Calculation: Assumes that everyone is sufficiently motivated to achieve satisfactory performance, hence qualifying for the vouchers, and ignoring general equilibrium effects due to the resultant increase in private school fees. Unit $VoucherCost$ used in our calculations is the increase in public educational expenditure per lottery winner, given in Angrist et al. (1535). This is multiplied by four because at any time, there are four cohorts in high school. Country cost = $(4/15) * VoucherCost * ChildPop * GDPCorrection$	Yes	1,478
Monetary rewards to parents for sending children to school	Source: Behrman, Segupta, and Todd 2001. Calculation: Assumes that if the subsidy is large enough, everyone will want to send their children to school, and therefore everyone will get the subsidy. Unit $SubsidyCost$ is calculated from data given in Behrman et al. (2001, 1). This is multiplied by seven because at any time there are four cohorts getting the subsidy. Country cost = $(7/15) * SubsidyCost * ChildPop * GDPCorrection$	Yes	2,3142
Nutrition supplementation			
Iron	Source: Bobonis, Miguel, and Sharma 2004. Calculation: Unit $IronCost$ data from Miguel and Bobonis, private communication. The program covers five cohorts aged between ages two and six. Country cost = $(5/15) * IronCost * ChildPop * PPPCorrection$	Yes	346

Where are we going?

- Rigor versus relevance
- Evaluation & scale-up
- Conclusions

Contract teachers

- ▶ Muralidharan & Sundararaman (2008)
Andhra Pradesh
Contract teachers \Rightarrow +0.15 std. dev.
- ▶ Duflo, Dupas, & Kremer (2009)
Western Kenya
Contract teachers \Rightarrow +0.21 std. dev.
Class size reduction \Rightarrow no effect on scores

Treatment Effect of Contract Teachers on Test Scores

Class-size effects: Woessman & West (2006) TIMSS data

Class-size effects: Lessons

1. Most striking feature is high variance, not high mean.
2. Heterogeneity is real (statistically significant) and affects both treatment and selection parameters.
3. No clear encompassing theory to explain widely variant OLS and (quasi-) experimental results – as required for any external validity claims.

OLS 'here' vs an RCT 'there'

For non-experimental estimates:

$$\text{MSE}(\tilde{\beta}_k) = \underbrace{\text{Var}(\tilde{\beta}_k)}_{\text{Sampling error}} + \underbrace{(\tilde{\beta}_k - \beta_k)^2}_{\text{Omitted var. bias}}$$

For experimental estimates:

$$\text{MSE}(\hat{\beta}_j) = \underbrace{\text{Var}(\hat{\beta}_j)}_{\text{Sampling error in context } j} + \underbrace{\text{Var}(\beta)}_{\text{Variance of true effect across contexts}}$$

Alternative evaluation models

Straw man model?

- ▶ Define an intervention defined at school level; evaluate in a controlled context; extrapolate.

Alternative models:

- ▶ Evaluate scale-up within large programs (Duflo & Kiessel 2013, Ghana TCAI).
- ▶ Mechanism experiments (Ludwig, Kling, and Mullainathan) applied within organizations to production of outputs.
- ▶ Move up the bureaucratic supply chain (Rasul & Roger 2013, Nigerian Civil Service).

Teacher Community Assistants Initiative

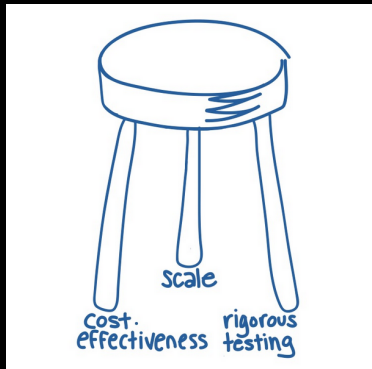

A project of the Ghana Education Service in collaboration with:

Ghana National Association of Teachers (GNAT)
National Youth Employment Program (NYEP)
Innovations for Poverty Action (IPA)

Republic of Ghana

Development Innovation Ventures (DIV) @ USAID

Conclusions

For evaluators:

- ▶ Specify context: Intervention may be both bigger and narrower than assumed.
- ▶ Encompass rather than trump: OLS estimates are facts demanding explanation.

For evaluation users:

- ▶ Avoid lexicographic preference for internal over external validity.
- ▶ Commission more, faster, cheaper RCTs with fewer grand ambitions.
